**New software version**

## UDS/SQL (BS2000/OSD) V2.5

UDS/SQL (BS2000/OSD) V2.5 contains the following enhancements compared with Version 2.4:

- UDS/SQL V2.5 makes DBAs far more productive: an automatic realm extension with utilities and a more flexible usage of storage media make the database administration easier. A new database job variable and an extended session job variable enhance the possibilities of automation of the database administration and of the session administration as well.
- UDS/SQL V2.5 offers higher availability reducing planned down times. Because UDS/SQL V2.5 facilitates a fast renaming of metadata (fields, record types, sets und realms) and a combining and splitting of database fields with no modification of user data.
- UDS/SQL V2.5 handles the storage resource more economically: UDS/SQL stores tables and lists compactly for restructuring purposes and uses a filling rate specified by the DBA.
- UDS/SQL V2.5 offers Unicode support.

**General release: 09.2007**
